

## Layered Architecture for MCU2

## ECU1 Components

### 1. MCAL

- **DIO Driver:**

Driver interface with ECU DIO peripheral which interduce DIO\_Set, DIO\_Reset, DIO\_Toggle, DIO\_Read APIs to upper layers.

- **TIMER Driver:**

Driver interface with ECU TIMER peripheral which interduce TIMER\_Init, TIMERDelay\_ms, Interrupts set call back APIs to upper layers.

- **CAN Driver:**

Driver interface with ECU CAN peripheral which interduce CAN\_Init, CAN\_Read, CAN\_Write APIs to upper layers

## 2. HAL

- **Light Driver:**

Module responsible for interface with right light and left light providing API LightOn and LightOff to control the car lights.

- **Buzzer Driver:**

- Module responsible for interface with Buzzer providing API BuzzerOn and BuzzerOff to control the car Buzzer.

## 3. SERVICES LAYER

- **BIT\_MATH:**

A header file contains functions like macros which perform bit manipulation SET\_BIT, RESET\_BIT, TOGGLE\_BIT, GETVAL\_BIT.

- **STD\_TYPES:**

A header file contains standard types u8, u16, u32, u64, s8, s16, s32, s64, f32, f64.

## 4. APPLICATION LAYER

The system has 3 tasks and 1 queue

- **Light task:**

The task is responsible for controlling the car lights on or off.

- **Buzzer task:**

The task is responsible for controlling the car Buzzer on or off.

- **Receive status task:**

The task is responsible for receive the system status sent from MCU1 through CAN bus.

- **Status queue:**

Intercommunication to sync status messages form Receive status task to the tasks.

# ECU2 APIs Discription

## 1. MCAL

- DIO Driver:

DIO
+ DIO_Init( void ) : void + DIO_Set( u8, u8 ) : void + DIO_Reset( u8,u8 ) : void + DIO_Toggle( u8,u8 ) : void + DIO_Read( u8,u8 ) : u8

### **DIO\_Init**

**Description:** This API use to initialize DIO ports directions

**Arguments:** void

**Return:** void

### **DIO\_Set**

**Description:** This API use to set the value of a DIO bin

**Arguments:** DIO\_PORT,BIN\_NUM

**Return:** void

### **DIO\_Reset**

**Description:** This API use to Reset the value of a DIO bin

**Arguments:** DIO\_PORT,BIN\_NUM

**Return:** void

### **DIO\_Toggle**

**Description:** This API use to Toggle the value of a DIO bin

**Arguments:** DIO\_PORT,BIN\_NUM

**Return:** void

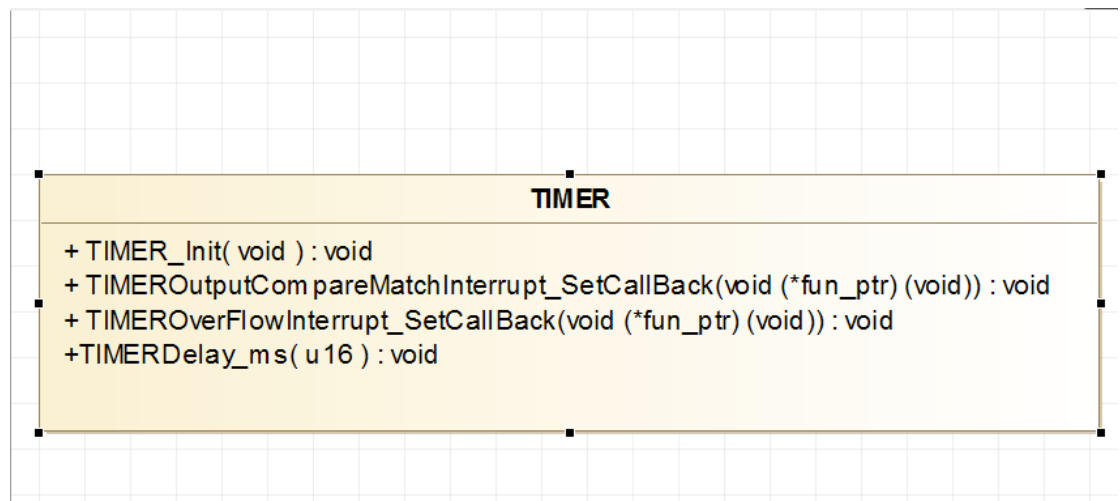

### **DIO\_Read**

**Description:** This API use to Read the value of a DIO bin

**Arguments:** DIO\_PORT,BIN\_NUM

**Return:** Boolean 0 or 1

## • **TIMER Driver:**

### **TIMER\_Init**

**Description:** This API use to initialize TIMER tick time

**Arguments:** void

**Return:** void

#### **TIMEROutputCompareMatchInterrupt\_SetCallBack**

**Description:** This API use to assign the address of timer compare match interrupt handler in his right place in vector table

**Arguments:** pointer to timer compare match interrupt handler

**Return:** void

#### **TIMEROverflowInterrupt\_SetCallBack**

**Description:** This API use to assign the address of timer over flow interrupt handler in his right place in vector table

**Arguments:** pointer to timer over flow interrupt handler

**Return:** void

#### **TIMERDelay\_ms**

**Description:** This API use to a delay using timer in milliseconds

**Arguments:** u16 which represent the desired delay in milliseconds

**Return:** void

- **CAN Driver:**

### **CAN\_Init**

**Description:** This API use to initialize CAN

**Arguments:** void

**Return:** void

### **CAN\_Read**

**Description:** This API use to read data sent through CAN bus

**Arguments:** void

**Return:** u8 data

### **CAN\_Write**

**Description:** This API use to write data through CAN bus

**Arguments:** u8 data

**Return:** void

## 2. HAL

- **Light Driver:**

Light
+LightOn( u8*,u8 ) : void +LightOff( u8*,u8 ) : void

### LightOn

**Description:** This API use to turn on the right and the left lights of the car.

**Arguments:** first argument reg\_name which is the DIO port that the car lights connected to it.

which represent a pointer to the address of the DIO register.

Second argument bit\_num which represent the bit number in the same register.

**Return:** void

## LightOff

**Description:** This API use to turn off the right and the left lights of the car.

**Arguments:** first argument reg\_name which is the DIO port that the car lights connected to it.

which represent a pointer to the address of the DIO register.

Second argument bit\_num which represent the bit number in the same register.

**Return:** void

- **Buzzer Driver:**

Buzzer
<pre>+BuzzerOn( u8*,u8 ) : void +BuzzerOff( u8*,u8 ) : void</pre>

## BuzzerOn

**Description:** This API use to turn on the Buzzer of the car.

**Arguments:** first argument reg\_name which is the DIO port that the car Buzzer connected to it.

which represent a pointer to the address of the DIO register.

Second argument bit\_num which represent the bit number in the same register.

**Return:** void

## BuzzerOff

**Description:** This API use to turn off the Buzzer of the car.

**Arguments:** first argument reg\_name which is the DIO port that the car Buzzer connected to it.

which represent a pointer to the address of the DIO register.

Second argument bit\_num which represent the bit number in the same register.

**Return:** void

### 3. SERVICES Layer

- **BIT\_MATH:**

BIT_MATH
+SET_BIT( u8, u8) : void +RESET_BIT( u8, u8) : void +TOGGLE_BIT( u8, u8) : void +GETVAL_BIT( u8, u8) : u8

#### **SET\_BIT**

**Description:** This is a function like macro which be replaced with  $\text{reg\_name} | = (1 \ll \text{bit\_num})$  to set the value of a DIO bin

**Arguments:**  $\text{reg\_name}$  which represent a pointer to the address of the register  
 $\text{bit\_num}$  which represent the bit number in the same register

**Return:** void

#### **RESET\_BIT**

**Description:** This is a function like macro which be replaced with  $\text{reg\_name} \&= \sim(1 \ll \text{bit\_num})$  to reset the value of a DIO bin

**Arguments:**  $\text{reg\_name}$  which represent a pointer to the address of the register

bit\_num which represent the bit number in the same register

**Return:** void

### **TOGGLE\_BIT**

**Description:** This is a function like macro which be replaced with  $\text{reg\_name} \wedge= (1 \ll \text{bit\_num})$  to toggle the value of a DIO bin

**Arguments:** reg\_name which represent a pointer to the address of the register  
bit\_num which represent the bit number in the same register

**Return:** void

### **GITVAL\_BIT**

**Description:** This is a function like macro which be replaced with  $(\text{reg\_name} \gg \text{bit\_num}) \& 1$  to get the value of a DIO bin

**Arguments:** reg\_name which represent a pointer to the address of the register  
bit\_num which represent the bit number in the same register

**Return:** u8 which represent the bin value

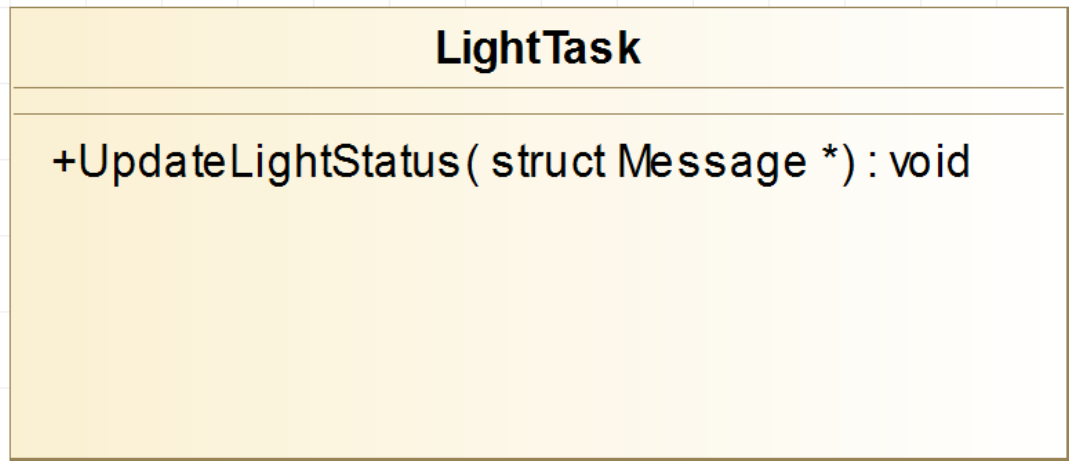

- **STD\_TYPES:**

STD_TYPES
+ typedef u8 : unsigned char
+ typedef u16 : unsigned short int
+ typedef u32 : unsigned int
+ typedef u64 : unsigned long int
+ typedef s8 : char
+ typedef s16 : short int
+ typedef s32 : int
+ typedef s64 : long int
+ typedef f32 : float
+ typedef f64 : double

**Description:** A header file contains standard types u8, u16, u32, u64, s8, s16, s32, s64, f32, f64.

## 4. APPLICATION Layer

- LightTask:

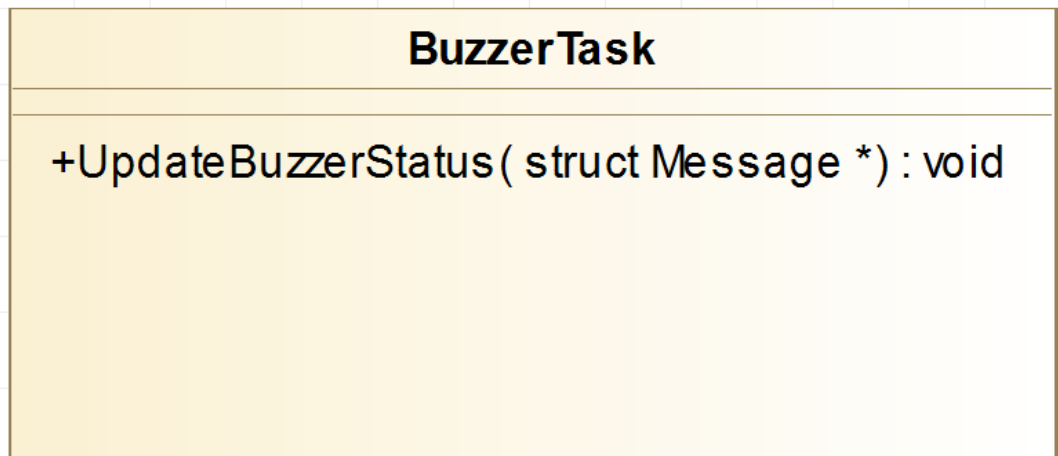

### UpdateLightStatus

**Description:** This is a function use to control the behavior of the right and the left lights based on sensors readings sent form MCU1

**Arguments:** pointer to struct Message

**Return:** void

- **BuzzerTask:**

### **UpdateBuzzerStatus**

**Description:** This is a function use to control the behavior of the Buzzer based on sensors readings sent form MCU1

**Arguments:** pointer to struct Message

**Return:** void

- **ReceiveStatusTask:**

<b>ReceiveStatusTask</b>
+ MSG : struct Message
+ ReceiveData( void ) : struct Message

### **ReceiveData**

**Description:** This is a function use to receive the reads of car sensors sent from MCU1 through CAN bus

**Arguments:** void

**Return:** struct Message

### **MSG**

**Description:** a struct variable contains the read of a car sensor sent from MCU1

# ECU2 Class diagram
